Abstract

Purpose – Women in entrepreneurship can have a significant impact on economic and social development globally and particularly in developing countries. But the challenges entrepreneurial women face are unique and multiple, pressing the need for research and policies to maximize impact. The purpose of this paper is to analyze the challenges women start-up founders face to secure funding in the technology industry. The tech industry was selected because it is a non-traditional industry for women with high potential for role models to bridge an existing gap in information on women start-up founders to secure capital financing to attain business sustainability. It covers venture capital investors’ role, Latin American cultural reasons, and gender.

Design/methodology/approach – This study is based on an inductive, qualitative approach and in-depth interviews with 20 women entrepreneurs and start-up founders from Latin American countries who received support from the Chilean Government sponsored accelerator “Start-Up Chile.”

Findings – The analysis uncovered ten aspects that impact entrepreneurial women founders’ access to capital in three categories: capital needs, networks, and individual characteristics.

Originality/value – This study identifies factors that affect women entrepreneurs in raising capital and in facing the following challenges: first, working in a non-traditional field for women as it is the technology industry, and second assuming a leadership role as start-up founders. The results offer recommendation with potential to drive public policies in Latin America, which may be scalable to other developing and also to developed countries where market systems prevail. The findings show that women entrepreneurs, but also men, seeking start-up financing and alternatives are a viable source of employment and economic sustainability to mitigate the effects of increasing levels of unemployment worldwide.

1. Introduction

In the last 50 years of expansion and consolidation of market systems as an economic development strategy, particularly in developing countries in Latin America and Asia, the private sector and entrepreneurial activity have experienced fast expansion as important drives of economic activity and robust growth. Market economies in developing countries have significantly improved living standards and the well-being of people. But in spite of solid progress, some obstacles persist and require attention in research and academic literature. Of
